

PD30 series - Photoelectric Sensors

Sensors

PD30 Series

Miniature photoelectric sensors

This new range of miniature high-performance sensors comes in three complete product lines: a PD30 STAINLESS STEEL family with IP69K and Ecolab certifications and superior durability, a cost-effective PD30 BASIC and *POINTSPOT* family with potentiometer adjustment and a refined PD30 ADVANCED family with teach-in function, dust warning, and options for muting and remote teaching. The PD30 sensor family combines excellent sensing abilities with an optimised compact housing design. Featuring a size of only 10.8 x 20 x 30 mm, it follows international industry standards. In addition, the PD30 family covers a wide variety of sensing principles to fit requirements of virtually any application: diffuse-reflective, background suppression, retro-reflective with or without polarization, even for transparent objects, as well as through-beam. These PD30 sensors are eminently suited for applications where space saving and high accuracy in detection are of vital importance.

Full range of PD30 sensors

World-class housing design

The compact and robust sensor housing in ABS-PMMA offers a high level of water and dust protection (IP 67). The Stainless steel version is IP69K and Ecolab certified.

High EMC performance

The microprocessor technology and the compact design ensure excellent EMC performance.

Environmentally friendly

This lead-free sensor is designed according to the RoHS directive. The highly advanced microprocessor design optimizes power consumption, allowing a 20% energy reduction compared to other sensors.

Simplified setup

Distance and sensing functions are easily set via the teach button or the remote teach wire on the PD30 ADVANCED sensors and via the freely adjustable potentiometer on the PD30 BASIC sensors, the PD30 *PointSpot* sensors and the PD30 Stainless steel sensors.

Space optimization

Despite its small size, PD30 offers the longest sensing range, managing distances formerly reached only by larger sensors.

Tamper-proof (PD30 Advanced series)

Connecting the remote teach wire to the power supply disables the push button and makes the sensor tamper-proof.

Diagnostic warning (PD30 Advanced series)

Two options are available: a 'dust output' that monitors the sensing performance and sends a signal if the sensor gets dirty, and a 'mute input' that allows a PLC to check the application for proper sensing operations.

Approvals

CE (EN60947-5-2)
cULus (UL508)

*) Only stainless steel

PD30 Series

PD30 Stainless Steel

The PD30 Stainless Steel sensor family is designed for use in harsh or hygienic environments. Built of excellent materials, the housing is resistant to high-pressure washdown, aggressive cleaning agents, and disinfectants. The sturdy stainless steel housing (AISI316L) together with high-quality plastic

materials like PEEK, PPSU, and PES sealings of FKM guarantee an outstanding mechanical resistance.

IP69K and Ecolab certified, these stainless steel sensors superiorly meet the demands of the food and beverage industry.

PD30 Advanced

Sensitivity adjustment is accessible and highly flexible due to the teach-in and remote teach functions offered by the PD30 Advanced sensor series. Using the remote teach function, the operator can set the sensor from a PLC. Furthermore, the Advanced series fea-

tures dust warning and mute input, ensuring that sensor malfunctions are timely detected, and costly machine downtime is avoided.

The Advanced series offers detection of transparent objects such as PET bottles.

PD30 Basic

The PD30 Basic sensor family presents a range of general-purpose sensors: economical, yet highly efficient! These sensors feature top or back potentiometer for sensitivity adjustment as well as background suppression

(BGS) based on a brand-new sensing principle which considerably increases the sensing distance (200 mm) and improves the detection accuracy of different colours.

PD30 PointSpot

The PD30 Basic sensor family includes a *PointSpot* version with a visible, small and precise red beam of light. The *PointSpot* emitter sends out a more concentrated light resulting in a clear-cut

light spot without any surrounding halo light to disturb the detection. The *PointSpot* sensors enable detection with precise accuracy.

PD30 Series

Miniature photoelectric sensors

Product types

Through-Beam

Separate emitter and receiver in a separate housing. A sensing distance of 15 m enables the sensor to be used in industrial settings where reliable detection is of primary importance. With a powerful infrared light beam, the sensor can see through various materials and determine whether content is present or not.

Retro-Reflective and Polarized Reflective

Emitter and receiver in one and the same housing. The signal from the emitter is sent to a reflector/passive device, and the need for wiring is reduced to one side of the application. The infrared retro-reflective sensor is primarily used in applications where the light beam must be invisible - for instance in entrance systems/doorways. The polarized reflective sensors are also able to detect objects with bright shiny surfaces.

Retro-Reflective PointSpot

Emitter and receiver in one and the same housing. The signal from the emitter is sent to a reflector/passive device, and the need for wiring is reduced to one side of the application. The retro-reflective *PointSpot* sensor emits a highly visible and well-defined light spot without any disturbing "halo". The polarized reflective sensors are also able to detect objects with bright shiny surfaces.

Retro-Reflective for transparent objects

Like retro-reflective sensors - but optimised to detect transparent objects such as PET bottles. The PD30 sensor features a long-range version suitable for supervising the jamming zone on both narrow and wide conveyor belts.

Diffuse-Reflective

Emitter and receiver in one and the same housing. A diffuse-reflective sensor without background suppression measures only energy returned from objects, which makes it ideal for structured surfaces because the sensor detects an average amount of light reflected.

Product types

Diffuse-Reflective - Extremely wide-angle

Emitter and receiver in one and the same housing. The diffuse-reflective sensor with an extremely wide detection angle can be used to detect PCBs despite large holes in the board, which means the PCB is registered as one PCB in the product cycle.

Background Suppression

A background suppression sensor detects an object using triangulation. Unlike a diffuse-reflective sensor, it is not colour-sensitive and is, therefore, capable of detecting a black object in front of, for instance, a white background.

Background Suppression PointSpot

A background suppression sensor detects an object using triangulation. The background suppression PointSpot sensor has an excellent colour variation suppression (same distance on all colours). In addition, the *PointSpot* sensor emits no disturbing halo light but produces a well-defined, visible light spot.

General features and functions

Electrical and optical design

PD30 standard

An optimised aspherical lens design allows for both a wide sensing angle and a long sensing range.

A PCB 'sandwich construction' together with microprocessor technology and a robust, functional analogue design provide optimised sensing and EMC performances, exceeding requirements from IEC. PD30 is a sensor optimised for industrial environments!

PD30 PointSpot

An optimised lens holder and lens design that generates the *PointSpot* light beam and eliminates the halo light for a precise and well-defined detection performance.

Micro-processor techniques featuring control of the emitter pulses, detection, signal filtration, synchronisation, LED indication control as well as the output and short-circuited detection. The sensitive parts of the sensor are shielded with a metal casing to achieve the best EMC performances. A sensor optimised for Industrial automation.

PD30 Stainless Steel - benefits

Highest degree of protection

The IP69K rating is for applications where high pressure and high temperature wash-down is used to sanitize equipment.

The PD30 Stainless steel housing withstands high-pressure cleaning processes with chemicals, and the sensor's object detection is continuous and reliable even in the harshest conditions. Certified by Ecolab.

PD30 Series

Miniature photoelectric sensors

PD30 Advanced - features and functions

PD30 Advanced - benefits

Mute function (sensor blanking)

When more than one set of through-beam sensors are mounted close to each other, mutual interference might occur. Controlling the mute function - for instance from a PLC - can form a multiplex system where only one set of sensors is active at a time and

neighbouring interference is avoided. The mute function is also used to check the sensor for malfunctions or disconnections. If the emitter is turned on and off periodically, any malfunction will be detected as early as possible and costly breakdowns are prevented.

Half mute function (> 3 sec.)

When manually aligned sensors are used over a long distance, condensation or dust can cause false signals. Activating the half mute function (> 3 sec.) will set the

emitter at half power. Aligning the sensor at half power ensures enough energy to make the sensor function properly when switching back to full power.

Dust alarm output

To prevent downtime of machinery, sensors have to be kept clean when used in dirty or dusty environments. The sensor will send an alarm signal over the dust output if it receives a low-

level signal for more than 20 ms. As a result, operators will know exactly when to clean the sensor, and sensors are cleaned only when necessary.

Remote teaching

Detection of diverse objects may require frequent modification of the sensor's settings such as distance and sensing overheads. A PLC connected to the remote teach input enables the

operator to change the sensor's settings while in operation. The teaching procedure is identical to the one used for manual teaching via the teach button.

PD30 *PointSpot* - principle

PD30 with standard emitter

An object with a high reflection placed within the light beam's halo but outside the primary light beam may cause an erroneous detection because the reflected light will hit the exact same spot on the receiver array.

PD30 with *PointSpot* emitter

As the *PointSpot* light has no halo, any object outside the primary beam will not be detected.

PD30 Series

Miniature photoelectric sensors

PD30 Basic - features and functions

PD30 Basic and Stainless Steel - new background suppression principle

The new PD30 Stainless Steel and BASIC background suppression sensor (BGS) is based on a brand-new sensing principle. This principle increases the sensing distance considerably (200 mm) and it improves the detection accuracy of different colours, suppressing the background even more efficiently.

This revolutionary sensing technology uses an Active Pixel Sensor (APS) CMOS array of 64 x 1 sensors, where each pixel represents a specific position. It takes advantage of the fact that

the reflected light hits the APS array at exactly the same position.

This way, the object's mass centre can be found regardless of the energy of the received light. Using this technology, grey, black and white objects are detected at almost exactly the same distance.

Furthermore, unlike traditional CCD arrays, the CMOS array benefits from being immune to the blooming effect - not letting the light bleed onto other pixels and disturbing the detection.

Applications

Meat, fish and poultry

The food industry's high demands on hygiene and cleanliness require equipment that can withstand daily washdown at high temperatures, high-pressure cleaning and harsh detergents.

Our solution

The PD30 Stainless steel sensors work perfectly even in the harshest environments. The high-quality stainless steel housing guarantees maximum mechanical resistance, and prescribed cleaning schedules are smoothly met without costly machine downtime.

Dairy and juice production

Multi-coloured cartons used in the dairy and juice industries constitute a significant challenge to object detection in the manufacturing process. For example in the production lines of yoghurt cups, the presence of lids on the cups must be detected and it is essential that lids are not confused with yoghurt in the cups.

Our solution

Our PD30 background suppression sensor superiorly detects all colours on objects in the same distance from the sensor, and its durable design withstands daily cleaning processes including high-pressure water jets (IP69K) as well as aggressive cleaning agents.

Food handling and packaging

Typically, packaging lines and production lines in the food industry are not subject to the same stringent requirements. For convenience and simplicity, however, the trend is towards identical cleaning procedures throughout.

designed for wet as well as dry areas in the Food and Beverage industry. The stainless steel housing and high-end plastic materials guarantee maximum resistance against IP69K and Ecolab cleaning processes. As a consequence, cleaning routines and instructions are kept homogenous and clearly defined all over the plant.

Our solution

The PD30 Stainless steel sensors are

Printed circuit board manufacturing

In the PCB Industry considerable problems can arise when it comes to detecting black components on a PCB.

are detected when passing. Since background suppression is based on triangulation, component colours will not affect the detection. To protect operators on the assembly line from being blinded by an upwardly directed sensor, the infrared PD30 sensor is the obvious choice.

Our solution

The PD30 background suppression sensor is positioned below the PCBs which

Applications

Coffee vending machines

In vending machines sensors often confuse cups and backgrounds such as a person drawing a cup of coffee.

Our solution

The PD30 background suppression sensor enhances the overall ease of use of

the vending machine. Using the new BGS technology, it can detect cups in different colours equally well and, at the same time, ignore people and irrelevant background noise in front of the machine.

End of material detection

End of spool detection of material supplied in narrow cassettes can be done using distance measurement. The sides of the cassette, however, can pose a problem because they are so tight that they might influence the detection.

Our solution

The PD30 sensor with *PointSpot* beam and background suppression ensures an absolutely precise detection which is not influenced by colour or reflections from the sides of the cassette.

Inspection control

An engine block must be examined to make sure that all the holes are present.

Our solution

Our PD30 background suppression sensor with its red visible *PointSpot* light can detect even tiny holes because of

the small beam diameter. Furthermore, since the *PointSpot* emitter produces no halo light, the surrounding parts of the hole are not unintentionally exposed to detection. Adjustment is easy due to the visible *PointSpot* beam.
